

# AI classical planning algorithms overview

	Graphplan	Boolean Satisf	Heuristic planning
Years of popularity*	1996-2000	1995-present	1999-present
Major concepts and approach	<ul style="list-style-type: none"> <li>In a forward phase, build a layered "planning graph" whose "time steps" capture which pairs of actions can achieve which pairs of facts;</li> <li>in a backward phase, search this graph starting at goals and excluding options proved to not be feasible.</li> </ul>	<ul style="list-style-type: none"> <li>Is good for to domain-independent planning**</li> <li>It converts the planning problem instance into an instance of the Boolean satisfiability problem (SAT)</li> <li>SAT is the problem of determining if there exists an interpretation that satisfies a given Boolean formula</li> </ul>	<ul style="list-style-type: none"> <li><b>Forward search</b> addresses the problem heuristically by trying to find patterns (subsets of propositions) that cover the independent subproblems.</li> <li><b>Fast downward.</b> Fast Downward (FD) is a progression planner, searching the space of world states of a planning task in the forward direction. However, the input is first translated into an alternative representation called multi-valued planning tasks, which makes many of the implicit constraints of a propositional planning task explicit.</li> </ul>
Impact on AI world	<ul style="list-style-type: none"> <li>Due to speed problem, partial ordered approach dominated in 80's and early 90's in AI</li> <li>it has the disadvantage of not having an explicit representation of states in the state-transition model</li> <li>Graphplan algorithm works faster than the partial-order planners and after inventing it, it is became possible to use all advantages of totally ordered algorithms and have reasonable time for calculation</li> </ul>	<ul style="list-style-type: none"> <li>The planners based on SAT win planners based on other search paradigms during win International Planning Competition (IPC) in 2006-2008</li> </ul>	<ul style="list-style-type: none"> <li>Heuristic approach let to work even when the subproblems are not completely independent.</li> <li>FD heuristic function, called the causal graph heuristic, unlike traditional HSP-like heuristics doesn't ignore negative interactions of operators and provides better performance for solving AI tasks</li> <li>Actually this planning approach dominate in AI world: planners win IPC in 2006, 2008 (<b>fast forward</b>), 2008, 2011, 2014, 2016 (<b>fast downward</b>)</li> </ul>
Major works and studies	<ul style="list-style-type: none"> <li>A. Blum and M. Furst, "Fast Planning Through Planning Graph Analysis", Artificial Intelligence, 90:281--300 (1997)</li> <li>Bryce, D., &amp; Kambhampati, S. (2007). A tutorial on planning graph - Based reachability heuristics. AI Magazine, 28(1), 47-83.</li> </ul>	<ul style="list-style-type: none"> <li>H. Kautz and B. Selman, Pushing the envelope: planning, propositional logic, and stochastic search, AAAI Press, 1996</li> <li>Jussi Rintanen. Heuristic planning with SAT: beyond strict depth-first search. Twenty-Third Australasian Joint Conference on Artificial Intelligence, Adelaide, December 7-10, 2010</li> </ul>	<ul style="list-style-type: none"> <li>Helmert, M. (2006). The fast downward planning system. JAIR, 26, 191-246.</li> <li>Fast Downward Aidos Jendrik Seipp and al. University of Basel Basel, Switzerland, 2016 (winner of last IPC)</li> </ul>

\*According to Jorg Hoffmann Wolfgang Wahlster "AI course" 2016 and International Planning competition results
